A Hardy's Uncertainty Principle Lemma in Weak Commutation Relations of Heisenberg-Lie Algebra

Toshimitsu TAKAESU

Faculty of Mathematics, Kyushu University, Fukuoka, 812-8581, Japan

Abstract. In this article we consider linear operators satisfying a generalized commutation relation of a type of the Heisenberg-Lie algebra. It is proven that a generalized inequality of the Hardy's uncertainty principle lemma follows. Its applications to time operators and abstract Dirac operators are also investigated.

Key words: weak commutation relations, Heisenberg-Lie algebra, time operators, Hamiltonians, time-energy uncertainty relation, Dirac operators, essential self-adjointness.

MSC 2010: 81Q10, 47B25, 46L60.

1 Introduction and Results

In this article we investigate a norm-inequality of the linear operators which obey a generalized weak commutation relation of a type of the Heisenberg-Lie algebra, and consider its application to the theory of the time operator [7, 2], and an abstract Dirac operator. Let $\mathbf{X} = \{X_j\}_{j=1}^N$, $\mathbf{Y} = \{Y_j\}_{j=1}^N$ and $\mathbf{Z} = \{Z_j\}_{j=1}^N$ be symmetric operators on a Hilbert space \mathcal{H} . The weak commutator of operators A and B is defined for $\psi \in \mathcal{D}(A) \cap \mathcal{D}(B)$ and $\phi \in \mathcal{D}(A^*) \cap \mathcal{D}(B^*)$ by

$$[A,B]^{W}(\phi,\psi) = (A^*\phi,B\psi) - (B^*\phi,A\psi).$$

Here the inner product has a linearity of $(\eta, \alpha \psi + \beta \phi) = \alpha(\eta, \psi) + \beta(\eta, \phi)$ for $\alpha, \beta \in \mathbb{C}$. We assume that $(\mathbf{X}, \mathbf{Y}, \mathbf{Z})$ satisfies the following conditions.

(**A.1**)
$$Z_i$$
, $1 \le j \le N$, is bounded operator.

(A.2) Let
$$\mathcal{D}_{\mathbf{X}} = \bigcap_{j=1}^{N} \mathcal{D}(X_{j})$$
 and $\mathcal{D}_{\mathbf{Y}} = \bigcap_{j=1}^{N} \mathcal{D}(Y_{j})$. It follows that for $\phi, \psi \in \mathcal{D}_{\mathbf{X}} \cap \mathcal{D}_{\mathbf{Y}}$,
$$[X_{j}, Y_{l}]^{w}(\phi, \psi) = \delta_{j, l}(\phi, iZ_{j}\psi),$$

$$[X_{j}, Z_{l}]^{w}(\phi, \psi) = [Y_{j}, Z_{l}]^{w}(\phi, \psi) = 0$$

$$[X_{i}, X_{l}]^{w}(\phi, \psi) = [Y_{i}, Y_{l}]^{w}(\phi, \psi) = [Z_{i}, Z_{l}]^{w}(\phi, \psi) = 0.$$

Note that $[Z_j, Z_l] \psi = 0$ follows for $\psi \in \mathcal{H}$, since Z_j , $j = 1, \dots, N$, is bounded. In this article we consider an generalization of the inequality

$$\int_{\mathbf{R}^N} \frac{1}{|\mathbf{r}|^2} |u(\mathbf{r})|^2 d\mathbf{r} \leq \frac{4}{(N-2)^2} \int_{\mathbf{R}^N} |\nabla u(\mathbf{r})|^2 d\mathbf{r}, \qquad N \geq 3$$

This inequality is a basic one of Hardy's uncertainty principle inequalities. For Hardy's uncertainty inequalities, refer to e.g. [5, 6, 13].

Let us introduce the additional conditions.

- (**A.3**) X_i is self-adjoint for all $1 \le j \le N$.
- (**A.4**) X_i and Z_l strongly commutes for all $1 \le j \le N$ and $1 \le l \le N$.

Sinne Z_j , $j = 1, \dots, N$, is bounded self-adjoint operator, we can set $\lambda_{\min}(\mathbf{Z})$ and $\lambda_{\max}(\mathbf{Z})$ by

$$\lambda_{\min}(\mathbf{Z}) = \min_{1 \leq j \leq N} \inf \sigma(Z_j),$$

 $\lambda_{\max}(\mathbf{Z}) = \max_{1 \leq j \leq N} \sup \sigma(Z_i).$

 $\lambda_{\max}(\mathbf{Z}) = \max_{1 \leq j \leq N} \sup \sigma(Z_j),$

where $\sigma(O)$ denotes the spectrum of the operator O.

Theorem 1 Assume (A.1)-(A.4). Let $\Psi \in \mathcal{D}(|\mathbf{X}|^{-1}) \cap \mathcal{D}_{\mathbf{X}} \cap \mathcal{D}_{\mathbf{Y}}$. Then the following (1) and (2) hold (1) If $N\lambda_{min}(\mathbf{Z}) - 2\lambda_{max}(\mathbf{Z}) > 0$, it follows that

$$\left\| |\mathbf{X}|^{-1} \Psi \right\|^2 \le \frac{4}{\left(N \lambda_{min}(\mathbf{Z}) - 2 \lambda_{max}(\mathbf{Z})\right)^2} \sum_{j=1}^{N} \left\| Y_j \Psi \right\|^2. \tag{1}$$

(2) If $2\lambda_{min}(\mathbf{Z}) - N\lambda_{max}(\mathbf{Z}) > 0$, it follows that

$$\| |\mathbf{X}|^{-1} \Psi \| \leq \frac{4}{(2\lambda_{min}(\mathbf{Z}) - N\lambda_{max}(\mathbf{Z}))^2} \sum_{i=1}^{N} \| Y_i \Psi \|^2.$$
 (2)

Before proving Theorem 1, let us consider the replacement of X and Y in Theorem 1. Let us introduce the following conditions substitute for (A.3) and (A.4).

- (A.5) Y_i is self-adjoint for all $1 \le j \le N$.
- (**A.6**) Y_i and Z_l strongly commutes for all $1 \le j \le N$ and $1 \le l \le N$.

It is seen from (A.2), that

$$[Y_i, X_l]^{\mathbf{w}}(\phi, \psi) = \delta_{i,l}(\phi, i(-Z_i)\psi), \qquad \phi, \psi \in \mathcal{D}_{\mathbf{X}} \cap \mathcal{D}_{\mathbf{Y}}.$$
(3)

Note that $\inf \sigma(-Z_i) = -\sup(Z_i)$ and $\sup(-Z_i) = -\inf \sigma(Z_i)$ follow. Then we obtain a following corollary:

Corollary 2 Assume (A.1)-(A.2) and (A.5)-(A.6). Let $\Psi \in \mathcal{D}(|\mathbf{Y}|^{-1}) \cap \mathcal{D}_{\mathbf{X}} \cap \mathcal{D}_{\mathbf{Y}}$. Then the following (1) and (2) hold.

(1) If $2\lambda_{min}(\mathbf{Z}) - N\lambda_{max}(\mathbf{Z}) > 0$, it follows that

$$\| |\mathbf{Y}|^{-1} \Psi \| \leq \frac{4}{(2\lambda_{min}(\mathbf{Z}) - N\lambda_{max}(\mathbf{Z}))^2} \sum_{j=1}^{N} \| X_j \Psi \|^2.$$
 (4)

(2) If $N\lambda_{min}(\mathbf{Z}) - 2\lambda_{max}(\mathbf{Z}) > 0$, it follows that

$$\| |\mathbf{Y}|^{-1} \Psi \| \leq \frac{4}{(N \lambda_{min}(\mathbf{Z}) - 2\lambda_{max}(\mathbf{Z}))^2} \sum_{j=1}^{N} \| X_j \Psi \|^2.$$
 (5)

(Proof of Theorem 1)

(1)Let $\Psi \in \mathcal{D}(|\mathbf{X}|^{-1}) \cap \mathcal{D}_{\mathbf{X}} \cap \mathcal{D}_{\mathbf{Y}}$. For $\varepsilon > 0$ and t > 0, it is seen that

$$\|(Y_{i} - itX_{i}(\mathbf{X}^{2} + \varepsilon)^{-1})\Psi\|^{2} = \|Y_{i}\Psi\|^{2} - it[Y_{i}, X_{i}(\mathbf{X}^{2} + \varepsilon)^{-1}]^{w}(\Psi, \Psi) + t^{2}\|X_{i}(\mathbf{X}^{2} + \varepsilon)^{-1}\Psi\|^{2}.$$
 (6)

We see that

$$[Y_i, X_i(\mathbf{X}^2 + \varepsilon)^{-1}]^{w}(\Psi, \Psi) = [Y_i, X_i]^{w}(\Psi, (\mathbf{X}^2 + \varepsilon)^{-1}\Psi) + [Y_i, (\mathbf{X}^2 + \varepsilon)^{-1}]^{w}(X_i\Psi, \Psi).$$
(7)

From (A.2) and (A.4), we obtain that

$$[Y_i, X_i]^{\mathbf{w}}(\Psi, (\mathbf{X}^2 + \varepsilon)^{-1}\Psi) = -i((\mathbf{X}^2 + \varepsilon)^{-1/2}\Psi, Z_i(\mathbf{X}^2 + \varepsilon)^{-1/2}\Psi). \tag{8}$$

Note that for a symmetric operator A and the non-negative symmetric operator B, the resolvent formula $[A,(B+\lambda)^{-1}]^w(v,u)=[B,A]^w((B+\lambda)^{-1}v,(B+\lambda)^{-1}u)$ for $\lambda>0$ follows. Then by using this formura, **(A.2)** and **(A.4)** yield that

$$[Y_j, (\mathbf{X}^2 + \varepsilon)^{-1}]^{\mathbf{w}}(X_j \Psi, \Psi) = 2i(X_j (\mathbf{X}^2 + \varepsilon)^{-1} u, Z_j X_j (\mathbf{X}^2 + \varepsilon)^{-1} u)$$
(9)

Since $\|(Y_j - itX_j(\mathbf{X}^2 + \varepsilon)^{-1})u\|^2 \ge 0$ and t > 0, we see from (7), (8) and (9) that

 $||Y_i\Psi||^2$

$$\geq -t^{2} \|X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}u\|^{2} + t\left((\mathbf{X}^{2}+\varepsilon)^{-1/2}\Psi, Z_{j}(\mathbf{X}^{2}+\varepsilon)^{-1/2}u\right) - 2t\left(X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}u, Z_{j}X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}\Psi\right)$$

$$\geq \left(-t^{2} - 2t\lambda_{\max}(\mathbf{Z})\right) \|X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}u\|^{2} + t\lambda_{\min}(\mathbf{Z})\|(\mathbf{X}^{2}+\varepsilon)^{-1/2}\Psi\|. \tag{10}$$

Then we have that

$$\sum_{j=1}^{N} \|Y_j \Psi\|^2 \ge \left(-t^2 - 2t\lambda_{\max}(\mathbf{Z}) \right) \left\| |\mathbf{X}| (\mathbf{X}^2 + \varepsilon)^{-1} \Psi \right\|^2 + tN\lambda_{\min}(\mathbf{Z}) \|(\mathbf{X}^2 + \varepsilon)^{-1/2} \Psi\|.$$
 (11)

Note that $\lim_{\epsilon \to 0} \left\| |\mathbf{X}| (\mathbf{X}^2 + \epsilon)^{-1} \Psi \right\|^2 = \||\mathbf{X}|^{-1} \Psi\|$ and $\lim_{\epsilon \to 0} \|(\mathbf{X}^2 + \epsilon)^{-1/2} \Psi\| = \||\mathbf{X}|^{-1} \Psi\| = 0$ follow from the spectral decomposition theorem. Then we have

$$\sum_{j=1}^{N} \|Y_j \Psi\|^2 \geq \left(-t^2 + (N\lambda_{\min}(\mathbf{Z}) - 2\lambda_{\max}(\mathbf{Z}))t \right) \| |\mathbf{X}|^{-1} \Psi \|.$$
 (12)

By taking $t = \frac{N\lambda_{\min}(\mathbf{Z}) - 2\lambda_{\max}(\mathbf{Z})}{2} > 0$ in the right side of (12), we obtain (1).

(2) By computing $\|(Y_j + itX_j(\mathbf{X}^2 + \varepsilon)^{-1})\Psi\|^2$ for t > 0 and $\varepsilon > 0$, in a similar way of (1), we see that

 $||Y_j\Psi||^2$

$$\geq -t^{2} \|X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}u\|^{2} - t\left((\mathbf{X}^{2}+\varepsilon)^{-1/2}\Psi, Z_{j}(\mathbf{X}^{2}+\varepsilon)^{-1/2}u\right) + 2t\left(X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}u, Z_{j}X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}\Psi\right)$$

$$\geq \left(-t^{2} + 2t\lambda_{\min}(\mathbf{Z})\right) \|X_{j}(\mathbf{X}^{2}+\varepsilon)^{-1}u\|^{2} - t\lambda_{\max}(\mathbf{Z})\|(\mathbf{X}^{2}+\varepsilon)^{-1/2}\Psi\|. \tag{13}$$

Then by taking $\varepsilon \to 0$ in the right side of (13), it follows that

$$\sum_{j=1}^{N} \|Y_j \Psi\|^2 \geq \left(-t^2 + \left(2\lambda_{\min}(\mathbf{Z}) - N\lambda_{\max}(\mathbf{Z}) \right) t \right) \| |\mathbf{X}|^{-1} \Psi \|.$$
 (14)

By taking $t = \frac{(2\lambda_{\min}(\mathbf{Z}) - N\lambda_{\max}(\mathbf{Z}))}{2} > 0$ in (14), we obtain (2). \blacksquare .

2 Applications

2.1 Time-Energy Uncertainty inequality

In this subsection we consider an application to the theory of time operators [2, 7]. Let H, T, and C be linear operators on a Hilbert space H. It is said that H has the weak time operator T with the uncommutative factor C if (H,T,C) satisfy the following conditions.

- (T.1) H and T are symmetric.
- (T.2) C is bounded and self-adjoint.
- **(T.3)** It follows that for $\phi, \psi \in \mathcal{D}(H) \cap \mathcal{D}(T)$,

$$[T,H]^{\mathrm{w}}(\phi,\psi) = (\phi,C\psi).$$

(T.4)

$$\delta_{\!C} \, := \inf_{\boldsymbol{\psi} \in (\ker C)^\perp \setminus \{0\}} \frac{|(\boldsymbol{\Psi}, C\boldsymbol{\Psi})|}{\|\boldsymbol{\psi}\|^2} \, > \, 0.$$

Assume that (H, T, C) satisfies (**T.1**)-(**T.4**). Then by using $||Au|| ||Bu|| \ge |\text{Im}(Au, Bu)| \ge \frac{1}{2} ||[A, B]^w(u, u)|$, it is seen that (H, T, C) satisfies the time-energy uncertainty inequality ([2], Proposition 4.1):

$$\frac{\| (H - \langle H \rangle_{\psi}) \psi \| \| (T - \langle T \rangle_{\psi}) \psi \|}{\| \psi \|^2} \geq \frac{\delta_C}{2}, \qquad \psi \in \mathcal{D}(H) \cap \mathcal{D}(T), \tag{15}$$

where $\langle O \rangle_{\psi} = (\psi, O\psi)$. From (2) in Theorem 1 and (1) in Corollary 2, we obtain another type of the inequality between T and H:

Corollary 3 (Time-Energy Uncertainty Inequalities)

Assume (T.1)-(T.3). Then the following (i) and (ii) hold.

(i) If T is self-adjoint, C and T strongly commute, and $\sup \sigma(C) < 2\inf \sigma(C)$, it follows that for $\psi \in \mathcal{D}(|T|^{-1}) \cap \mathcal{D}(T) \cap \mathcal{D}(H)$,

$$\left\| |T|^{-1} \psi \right\| \leq \frac{2}{2 \inf \sigma(C) - \sup \sigma(C)} \left\| H \Psi \right\|. \tag{16}$$

(ii) If H is self-adjoint, C and H strongly commute, and $\sup \sigma(C) < 2\inf \sigma(C)$, it follows that for $\psi \in \mathcal{D}(|H|^{-1}) \cap \mathcal{D}(H) \cap \mathcal{D}(T)$,

$$\left\| |H|^{-1} \psi \right\| \leq \frac{2}{2\inf \sigma(C) - \sup \sigma(C)} \left\| T \Psi \right\|. \tag{17}$$

2.2 Abstract Dirac Operators with Coulomb Potential

Next tlt us consider the application to abstract Dirac operators. We consider the self-adjoint operators $\mathbf{P} = \{P_j\}_{j=1}^N$ and $\mathbf{Q} = \{Q_j\}_{j=1}^N$ on a Hilbert space \mathcal{H} . Let us set a subspace $\mathcal{D} \subset \cap_{j,l} (\mathcal{D}(P_j) \cap \mathcal{D}(Q_l))$. It is said that $(\mathcal{H}, \mathcal{D}, \mathbf{P}, \mathbf{Q})_N$ is the weak representation of the CCR with degree N, if \mathcal{D} is dense in \mathcal{H} and it follows that for $\phi, \psi \in \mathcal{D}$,

$$[P_j, Q_l]^{W}(\phi, \psi) = i\delta_{j,l}(\phi, \psi),$$

 $[P_j, P_l]^{W}(\phi, \psi) = [Q_j, Q_l]^{W}(\phi, \psi) = 0.$

Let us define an abstract Dirac operator as follows. Let $(\mathcal{H}, \mathcal{D}, \mathbf{P}, \mathbf{Q})_3$ be the weak representation of the CCR with degree three. Let $\mathbf{A} = \{A_j\}_{j=1}^3$ and B be the bounded self-adjoint operators on a Hilbert space \mathcal{K} . Here $\mathbf{A} = \{A_j\}_{j=1}^3$ and B satisfy the canonical anti-commutation relations $\{A_j, A_l\} = 2\delta_{j,l}$, $\{A_j, B\} = 0$, $B^2 = I_{\mathcal{K}}$ where $I_{\mathcal{K}}$ is the identity operator on \mathcal{K} . The state Hilbert space space is defined by $\mathcal{H}_{\text{Dirac}} = \mathcal{K} \otimes \mathcal{H}$. The free abstract Dirac operator is defiend by

$$H_0 = \sum_{j=1}^3 A_j \otimes P_j + B \otimes M.$$

Here we assume the following condition.

(D.1) P_j and P_l strongly commute for $1 \le j \le 3$, $1 \le l \le 3$. P_j , $1 \le j \le 3$, and M strongly commute.

Then it is seen that $H_0^2\Psi = (\mathbf{P}^2 + M^2)\Psi$ for $\Psi \in \mathcal{D}$. The abstract Dirac Operator with the Coulomb potential is defined by

$$H(\kappa) = H_0 + \kappa I_{\mathfrak{K}} \otimes |\mathbf{Q}|^{-1},$$

where $\kappa \in \mathbf{R}$ is a parameter called the coupling constant. We assume that the following condition

(D.2) It follows that
$$\mathcal{D} \subset \mathcal{D}(\mathbf{Q}|^{-1})$$
.

Then it follows from (1) in Theorem 1 that for $\psi \in \mathcal{D}$,

$$||I_{\mathcal{K}} \otimes |\mathbf{Q}|^{-1}\psi||^2 \le 4 \sum_{i=1}^3 ||P_j\Psi||^2 \le 4 ||H_0\Psi||^2.$$

Hence by the Kato-Rellich theorem, we obtain the following corollary.

Corollary 4 Assume (**D.1**) and (**D.2**). Then for $|\kappa| < \frac{1}{2}$, $H(\kappa)$ is essentially self-adjoint on \mathfrak{D} .

Acknowledgments

It is pleasure to thank assistant professor Akito Suzuki and associate professor Fumio Hiroshima for their advice and comments.

MI2010-6 Shuichi KAWANO, Toshihiro MISUMI & Sadanori KONISHI Semi-supervised logistic discrimination via graph-based regularization

MI2010-7 Teruhisa TSUDA

UC hierarchy and monodromy preserving deformation

MI2010-8 Takahiro ITO

Abstract collision systems on groups

MI2010-9 Hiroshi YOSHIDA, Kinji KIMURA, Naoki YOSHIDA, Junko TANAKA & Yoshihiro MIWA

An algebraic approach to underdetermined experiments

MI2010-10 Kei HIROSE & Sadanori KONISHI

Variable selection via the grouped weighted lasso for factor analysis models

MI2010-11 Katsusuke NABESHIMA & Hiroshi YOSHIDA

Derivation of specific conditions with Comprehensive Groebner Systems

MI2010-12 Yoshiyuki KAGEI, Yu NAGAFUCHI & Takeshi SUDOU

Decay estimates on solutions of the linearized compressible Navier-Stokes equation around a Poiseuille type flow

MI2010-13 Reiichiro KAWAI & Hiroki MASUDA

On simulation of tempered stable random variates

MI2010-14 Yoshiyasu OZEKI

Non-existence of certain Galois representations with a uniform tame inertia weight

MI2010-15 Me Me NAING & Yasuhide FUKUMOTO

Local Instability of a Rotating Flow Driven by Precession of Arbitrary Frequency

MI2010-16 Yu KAWAKAMI & Daisuke NAKAJO

The value distribution of the Gauss map of improper affine spheres

MI2010-17 Kazunori YASUTAKE

On the classification of rank 2 almost Fano bundles on projective space

MI2010-18 Toshimitsu TAKAESU

Scaling limits for the system of semi-relativistic particles coupled to a scalar bose field

MI2010-19 Reiichiro KAWAI & Hiroki MASUDA

Local asymptotic normality for normal inverse Gaussian Lévy processes with high-frequency sampling

MI2010-20 Yasuhide FUKUMOTO, Makoto HIROTA & Youichi MIE

Lagrangian approach to weakly nonlinear stability of an elliptical flow

MI2010-21 Hiroki MASUDA

Approximate quadratic estimating function for discretely observed Lévy driven SDEs with application to a noise normality test

MI2010-22 Toshimitsu TAKAESU

A Generalized Scaling Limit and its Application to the Semi-Relativistic Particles System Coupled to a Bose Field with Removing Ultraviolet Cutoffs

MI2010-23 Takahiro ITO, Mitsuhiko FUJIO, Shuichi INOKUCHI & Yoshihiro MIZOGUCHI Composition, union and division of cellular automata on groups

MI2010-24 Toshimitsu TAKAESU

A Hardy's Uncertainty Principle Lemma in Weak Commutation Relations of Heisenberg-Lie Algebra
