# THE TRANSITIVE CLOSURE OF FUZZY RELATIONS WITH A CONTRACTION PROPERTY

By

Yuji YOSHIDA \*

## Abstract

This paper analyses transitive closures of fuzzy relations on a compact metric space with a contraction property in [2]. We show that the transitive closure is a unique solution of a fuzzy relational equation and also has the same contraction property.

### 1. Introduction and notations

Let  $E$  be a compact metric space and  $d$  be a metric on  $E$ .  $\mathcal{C}(E)$  denotes the collection of all closed subsets of  $E$ . We put  $d(x, D) := \inf_{y \in D} d(x, y)$ ,  $x \in E, D \in \mathcal{C}(E)$ . Let  $\rho$  be the Hausdorff metric on  $\mathcal{C}(E)$ . Then it is well-known ([1]) that  $(\mathcal{C}(E), \rho)$  is a compact metric space. Let  $\mathcal{F}(E)$  be the set of all fuzzy sets  $\tilde{s} : E \rightarrow [0, 1]$  which are upper semi-continuous and satisfy  $\sup_{x \in E} \tilde{s}(x) = 1$ .

For a fuzzy relation  $\tilde{r} : E \times E \rightarrow [0, 1]$  satisfying  $\tilde{r}(x, \cdot) \in \mathcal{F}(E)$  ( $x \in E$ ), we define a map  $\tilde{r}_\alpha : \mathcal{C}(E) \rightarrow \mathcal{C}(E)$  ( $\alpha \in [0, 1]$ ) by

$$\tilde{r}_\alpha(D) := \begin{cases} \{y \mid \tilde{r}(x, y) \geq \alpha \text{ for some } x \in D\} & \text{for } \alpha \neq 0, D \in \mathcal{C}(E), D \neq \emptyset, \\ \text{cl}\{y \mid \tilde{r}(x, y) > 0 \text{ for some } x \in D\} & \text{for } \alpha = 0, D \in \mathcal{C}(E), D \neq \emptyset, \\ E & \text{for } 0 \leq \alpha \leq 1, D = \emptyset, \end{cases} \quad (1.1)$$

where  $\text{cl}$  denotes the closure of a set. Let  $\mathcal{R}(E)$  be the set of all fuzzy relations  $\tilde{r} : E \times E \rightarrow [0, 1]$  which satisfy  $\tilde{r}(x, \cdot) \in \mathcal{F}(E)$  ( $x \in E$ ) and

$$\sup_{\alpha \in [0, 1]} \rho(\tilde{r}_\alpha(y), \tilde{r}_\alpha(x)) \rightarrow 0 \quad (y \rightarrow x) \quad \text{for } x \in E. \quad (1.2)$$

We denote the maximum operation and the minimum operation by  $\vee$  and  $\wedge$  respectively. Let  $\tilde{q} \in \mathcal{R}(E)$  be a continuous fuzzy relation. We define sequences of fuzzy relations  $\{\tilde{q}^n\}_{n=1,2,\dots}$  and  $\{\tilde{c}^m\}_{m=1,2,\dots}$  by

$$\tilde{q}^1 := \tilde{q} \quad \text{and} \quad \tilde{q}^{n+1}(x, y) := \sup_{z \in E} \{\tilde{q}(x, z) \wedge \tilde{q}^n(z, y)\}, \quad x, y \in E, \quad n = 1, 2, \dots; \quad (1.3)$$

$$\tilde{c}^m(x, y) := \bigvee_{n=1,2,\dots,m} \tilde{q}^n(x, y), \quad x, y \in E, \quad m = 1, 2, \dots. \quad (1.4)$$

---

\* Department of Business Administration, Faculty of Economics and Business Administration, Kitakyushu University, Kitagata 4-2-1, Kokuraminami, Kitakyushu 802, Japan

If  $E$  is finite, then the transitive closure of the fuzzy relation  $\tilde{q}$  is given ([5]) by

$$\bigvee_{n=1,2,\dots} \tilde{q}^n(x, y), \quad x, y \in E. \quad (1.5)$$

This paper discusses the transitive closure when  $E$  is a general compact metric space. From now on we assume the following contraction property.

ASSUMPTION (Contraction property, [2]). There exists a real number  $\beta$  ( $0 < \beta < 1$ ) satisfying the following condition :

$$\rho(\tilde{q}_\alpha(A), \tilde{q}_\alpha(B)) \leq \beta \rho(A, B) \quad \text{for all } A, B \in \mathcal{C}(E) \text{ and all } \alpha \in [0, 1]. \quad (1.6)$$

We call  $\beta$  a contraction factor.

LEMMA 1. *The condition (1.6) is equivalent to the following condition :*

$$\rho(\tilde{q}_\alpha(x), \tilde{q}_\alpha(y)) \leq \beta d(x, y) \quad \text{for all } x, y \in E \text{ and all } \alpha \in [0, 1], \quad (1.7)$$

where  $\tilde{q}_\alpha(x) := \tilde{q}_\alpha(\{x\})$  ( $x \in E, \alpha \in [0, 1]$ ).

PROOF. We can obtain (1.7) from (1.6), taking  $A = \{x\}$ ,  $B = \{y\}$ . Conversely we assume (1.7). Let  $A, B \in \mathcal{C}(E)$ . Since  $\tilde{q}_\alpha(x) \subset \tilde{q}_\alpha(A)$  for all  $x \in A$  and  $\tilde{q}_\alpha(y) \subset \tilde{q}_\alpha(B)$  for all  $y \in B$ ,

$$\begin{aligned} \rho(\tilde{q}_\alpha(A), \tilde{q}_\alpha(B)) &= \max\left\{\max_{x' \in \tilde{q}_\alpha(A)} d(x', \tilde{q}_\alpha(B)), \max_{y' \in \tilde{q}_\alpha(B)} d(\tilde{q}_\alpha(A), y')\right\} \\ &\leq \max\left\{\max_{x' \in \tilde{q}_\alpha(A)} \min_{y \in B} d(x', \tilde{q}_\alpha(y)), \max_{y' \in \tilde{q}_\alpha(B)} \min_{x \in A} d(\tilde{q}_\alpha(x), y')\right\}. \end{aligned}$$

Here since  $\tilde{q}_\alpha(A) = \bigcup_{x \in A} \tilde{q}_\alpha(x)$ , we have

$$\max_{x' \in \tilde{q}_\alpha(A)} \min_{y \in B} d(x', \tilde{q}_\alpha(y)) = \max_{x \in A} \max_{x' \in \tilde{q}_\alpha(x)} \min_{y \in B} d(x', \tilde{q}_\alpha(y)) \leq \max_{x \in A} \min_{y \in B} \rho(\tilde{q}_\alpha(x), \tilde{q}_\alpha(y)).$$

Similarly

$$\max_{y' \in \tilde{q}_\alpha(B)} \min_{x \in A} d(\tilde{q}_\alpha(x), y') \leq \max_{y \in B} \min_{x \in A} \rho(\tilde{q}_\alpha(x), \tilde{q}_\alpha(y)).$$

Therefore we obtain

$$\rho(\tilde{q}_\alpha(A), \tilde{q}_\alpha(B)) \leq \max\left\{\max_{x \in A} \min_{y \in B} \rho(\tilde{q}_\alpha(x), \tilde{q}_\alpha(y)), \max_{y \in B} \min_{x \in A} \rho(\tilde{q}_\alpha(x), \tilde{q}_\alpha(y))\right\}.$$

From (1.7), we get

$$\rho(\tilde{q}_\alpha(A), \tilde{q}_\alpha(B)) \leq \beta \max\left\{\max_{x \in A} \min_{y \in B} d(x, y), \max_{y \in B} \min_{x \in A} d(x, y)\right\} = \beta \rho(A, B).$$

Therefore we obtain (1.6). ■

DEFINITION 1. ([3]) For  $\tilde{r}_n, \tilde{r} \in \mathcal{R}(E)$ ,

$$\lim_{n \rightarrow \infty} \tilde{r}_n = \tilde{r}$$

means

$$\sup_{\alpha \in [0,1]} \rho(\tilde{r}_{n,\alpha}(D), \tilde{r}_\alpha(D)) \rightarrow 0 \quad (n \rightarrow \infty) \quad \text{for } D \in \mathcal{C}(E),$$

where  $\tilde{r}_{n,\alpha}, \tilde{r}_\alpha$  are defined by (1.1) for the fuzzy relations  $\tilde{r}_n, \tilde{r}$  respectively.

LEMMA 2. ([2, Lemma 2]) Suppose a family of subsets  $\{D_\alpha \mid \alpha \in [0, 1]\} \subset \mathcal{C}(E)$  satisfies the following conditions:

- (i)  $D_\alpha \subset D_{\alpha'}$  for  $\alpha' \leq \alpha$ .
- (ii)  $\lim_{\alpha' \uparrow \alpha} D_{\alpha'} = D_\alpha$ , i.e.,  $\lim_{\alpha' \uparrow \alpha} \rho(D_{\alpha'}, D_\alpha) = 0$  for  $\alpha \in (0, 1]$ .

Then it holds that

$$\lim_{\alpha' \uparrow \alpha} \tilde{q}_{\alpha'}(D_{\alpha'}) = \tilde{q}_\alpha(D_\alpha) \quad \text{for } \alpha \in (0, 1]. \quad (1.8)$$

LEMMA 3. We suppose that a family of subsets  $\{D_\alpha(x) \mid x \in E, \alpha \in [0, 1]\} \subset \mathcal{C}(E)$  satisfies the following conditions (i) – (iii) :

- (i)  $D_\alpha(x) \subset D_{\alpha'}(x)$  for  $x \in E, 0 \leq \alpha' < \alpha \leq 1$ .
- (ii)  $\lim_{\alpha' \uparrow \alpha} D_{\alpha'}(x) = D_\alpha(x)$  for  $x \in E, \alpha \in (0, 1]$ .
- (iii)  $\sup_{\alpha \in [0,1]} \rho(D_\alpha(y), D_\alpha(x)) \rightarrow 0 \quad (y \rightarrow x)$  for  $x \in E$ .

Then

$$\tilde{r}(x, y) := \sup_{\alpha \in [0,1]} \{\alpha \wedge I_{D_\alpha(x)}(y)\}, \quad x, y \in E,$$

satisfies  $\tilde{r} \in \mathcal{R}(E)$  and  $\tilde{r}_\alpha(x) = D_\alpha(x)$  for all  $x \in E, \alpha \in [0, 1]$ .

PROOF. Fix any  $x \in E$ . By [4], from the conditions (i) and (ii), we have  $\tilde{r}(x, \cdot) \in \mathcal{F}(E)$  and  $\tilde{r}_\alpha(x) = \{y \in E \mid \tilde{r}(x, y) \geq \alpha\} = D_\alpha(x)$  for  $\alpha \in (0, 1]$ . Therefore (1.2) holds from (iii). Thus we get  $\tilde{r} \in \mathcal{R}(E)$ .  $\blacksquare$

We define maps  $\tilde{q}_\alpha^n : \mathcal{C}(E) \mapsto \mathcal{C}(E)$  ( $n = 1, 2, \dots, \alpha \in [0, 1]$ ) by  $\tilde{q}_\alpha^1 := \tilde{q}_\alpha$  and  $\tilde{q}_\alpha^{n+1} := \tilde{q}_\alpha(\tilde{q}_\alpha^n)$  ( $n = 1, 2, \dots$ ).

LEMMA 4. Let  $\alpha \in [0, 1]$ . Then :

- (i)  $(\tilde{q}^n)_\alpha(D) = \tilde{q}_\alpha^n(D), \quad D \in \mathcal{C}(E) \quad \text{for } n = 1, 2, \dots;$
- (ii)  $(\tilde{c}^n)_\alpha(D) = \bigcup_{n=1,2,\dots,m} \tilde{q}_\alpha^n(D), \quad D \in \mathcal{C}(E) \quad \text{for } m = 1, 2, \dots.$

PROOF. We have (i) from [2, Lemma 1] and (1.3). Further (ii) is trivial from (1.4). ■

LEMMA 5. It holds that

$$\rho(A \cup C, B \cup D) \leq \max\{\rho(A, B), \rho(C, D)\} \quad \text{for } A, B, C, D \in \mathcal{C}(E).$$

PROOF. Let  $A, B, C, D \in \mathcal{C}(E)$ . Then

$$\begin{aligned} \rho(A \cup C, B \cup D) &= \max\left\{\max_{x \in A \cup C} d(x, B \cup D), \max_{y \in B \cup D} d(A \cup C, y)\right\} \\ &= \max\left\{\max_{x \in A} d(x, B \cup D), \max_{y \in B} d(A \cup C, y), \max_{x \in C} d(x, B \cup D), \max_{y \in D} d(A \cup C, y)\right\} \\ &\leq \max\left\{\max_{x \in A} d(x, B), \max_{y \in B} d(A, y), \max_{x \in C} d(x, D), \max_{y \in D} d(C, y)\right\} \\ &= \max\{\rho(A, B), \rho(C, D)\}. \end{aligned}$$

Therefore we obtain this lemma. ■

## 2. Main results

We discuss the convergence of the sequence of fuzzy relations  $\{\tilde{c}^m\}_{m=1}^\infty$ .

THEOREM 1.

(i) *There exists a unique solution  $\tilde{c} \in \mathcal{R}(E)$  of the following fuzzy relational equation :*

$$\tilde{c}(x, y) = \tilde{q}(x, y) \vee \max_{z \in E} \{\tilde{c}(x, z) \wedge \tilde{q}(z, y)\} \quad x, y \in E. \quad (2.1)$$

(ii) *The fuzzy relation  $\tilde{c}$  also has the contraction property with the same contraction factor  $\beta$ .*

(iii) *The fuzzy relation  $\tilde{c}$  equals to the limit of  $\{\tilde{c}^m\}_{m=1}^\infty$  :*

$$\tilde{c} = \lim_{m \rightarrow \infty} \tilde{c}^m. \quad (2.2)$$

PROOF. Define a map  $T_{x, \alpha} : \mathcal{C}(E) \rightarrow \mathcal{C}(E)$  ( $x \in E, \alpha \in [0, 1]$ ) by

$$T_{x, \alpha}(D) := \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(D), \quad D \in \mathcal{C}(E).$$

From Lemma 5,

$$\begin{aligned} \rho(T_{x, \alpha}(D), T_{x, \alpha}(D')) &= \rho(\tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(D), \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(D')) \\ &\leq \rho(\tilde{q}_\alpha(D), \tilde{q}_\alpha(D')) \\ &\leq \beta \rho(D, D'), \quad D, D' \in \mathcal{C}(E), \quad x \in E, \quad \alpha \in [0, 1]. \end{aligned}$$

Since the metric space  $(\mathcal{C}(E), \rho)$  is compact, from the Banach's fixed point theorem, there exists a family  $\{A_\alpha(x) \mid x \in E, \alpha \in [0, 1]\} \subset \mathcal{C}(E)$  such that

$$\tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(A_\alpha(x)) = T_{x,\alpha}(A_\alpha(x)) = A_\alpha(x), \quad x \in E, \alpha \in [0, 1],$$

and  $\lim_{n \rightarrow \infty} T_{x,\alpha}^n(D) = A_\alpha(x)$  for any  $D \in \mathcal{C}(E)$ . From the definition of  $\tilde{q}_\alpha$ ,  $T_{x,\alpha'}(D) = \tilde{q}_{\alpha'}(x) \cup \tilde{q}_{\alpha'}(D) \supset \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(D) = T_{x,\alpha}(D)$  for  $\alpha' \leq \alpha$ . Inductively we have  $T_{x,\alpha'}^n(D) \supset T_{x,\alpha}^n(D)$  for  $n = 1, 2, \dots$ . By letting  $n \rightarrow \infty$ , we obtain

$$A_{\alpha'}(x) \supset A_\alpha(x) \quad \text{for } \alpha' \leq \alpha. \quad (2.3)$$

Let  $\alpha' \leq \alpha$ . Inductively we have

$$\begin{aligned} \rho(A_\alpha(x), A_{\alpha'}(x)) &= \rho(T_{x,\alpha}^n(A_\alpha(x)), T_{x,\alpha'}^n(A_{\alpha'}(x))) \\ &\leq \rho(T_{x,\alpha'}^n(A_\alpha(x)), T_{x,\alpha}^n(A_\alpha(x))) + \rho(T_{x,\alpha'}^n(A_{\alpha'}(x)), T_{x,\alpha'}^n(A_\alpha(x))) \\ &\leq \rho(T_{x,\alpha'}^n(A_\alpha(x)), T_{x,\alpha}^n(A_\alpha(x))) + \beta^n \rho(A_{\alpha'}(x), A_\alpha(x)), \quad n = 1, 2, \dots \end{aligned}$$

Then  $\rho(A_{\alpha'}(x), A_\alpha(x))$  is uniformly bounded since  $E$  is compact. We put  $\rho(A_{\alpha'}(x), A_\alpha(x)) \leq M$  for some  $M > 0$ . Therefore

$$\rho(A_\alpha(x), A_{\alpha'}(x)) \leq \rho(T_{x,\alpha'}^n(A_\alpha(x)), T_{x,\alpha}^n(A_\alpha(x))) + \beta^n M, \quad n = 1, 2, \dots \quad (2.4)$$

By Lemma 2, we have  $\lim_{\alpha' \uparrow \alpha} T_{x,\alpha'}(A_\alpha(x)) = \lim_{\alpha' \uparrow \alpha} \{\tilde{q}_{\alpha'}(x) \cup \tilde{q}_{\alpha'}(A_\alpha(x))\} = \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(A_\alpha(x)) = T_{x,\alpha}(A_\alpha(x))$ . Repeating these arguments inductively,

$$\lim_{\alpha' \uparrow \alpha} T_{x,\alpha'}^n(A_\alpha(x)) = T_{x,\alpha}^n(A_\alpha(x)), \quad n = 1, 2, \dots$$

Therefore (2.4) follows

$$\lim_{\alpha' \uparrow \alpha} \rho(A_\alpha(x), A_{\alpha'}(x)) \leq \beta^n M, \quad n = 1, 2, \dots$$

By letting  $n \rightarrow \infty$ , we obtain

$$\lim_{\alpha' \uparrow \alpha} A_{\alpha'}(x) = A_\alpha(x). \quad (2.5)$$

Let  $\alpha \in [0, 1]$  and  $x, y \in E$ . From Lemma 5 and the contraction property of  $\tilde{q}$ , we have

$$\begin{aligned} \rho(T_{y,\alpha}(D), T_{x,\alpha}(D')) &= \rho(\tilde{q}_\alpha(y) \cup \tilde{q}_\alpha(D), \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(D')) \\ &\leq \max\{\rho(\tilde{q}_\alpha(y), \tilde{q}_\alpha(x)), \rho(\tilde{q}_\alpha(D), \tilde{q}_\alpha(D'))\} \\ &\leq \beta \max\{d(y, x), \rho(D, D')\}, \quad D, D' \in \mathcal{C}(E). \end{aligned}$$

Repeating these arguments inductively,

$$\rho(T_{x,\alpha}^n(D), T_{x,\alpha}^n(D')) \leq \max\{\beta d(y, x), \beta^n \rho(D, D')\}, \quad D, D' \in \mathcal{C}(E), \quad n = 1, 2, \dots$$

Since  $\rho(D, D')$  is uniformly bounded, letting  $n \rightarrow \infty$ , we obtain

$$\rho(A_\alpha(y), A_\alpha(x)) \leq \beta d(y, x) \quad \text{for } x, y \in E. \quad (2.6)$$

Therefore

$$\sup_{\alpha \in [0,1]} \rho(A_\alpha(y), A_\alpha(x)) \rightarrow 0 \quad (y \rightarrow x) \quad \text{for } x \in E.$$

Thus the family  $\{A_\alpha(x) \mid x \in E, \alpha \in [0, 1]\}$  satisfies the conditions (i) – (iii) of Lemma 3. By Lemma 3, we can define a fuzzy relation  $\tilde{c} \in \mathcal{R}(E)$  by

$$\tilde{c}(x, y) := \sup_{\alpha \in [0,1]} \{\alpha \wedge I_{A_\alpha(x)}(y)\}, \quad x, y \in E.$$

Then  $\tilde{c}_\alpha(x) = A_\alpha(x)$  ( $x \in E, \alpha \in [0, 1]$ ). Since  $A_\alpha(x)$  is a unique fixed point of  $T_{x,\alpha}$ ,

$$\lim_{n \rightarrow \infty} (\tilde{c}^n)_\alpha(x) = \lim_{n \rightarrow \infty} T_{x,\alpha}^n(\{x\}) = A_\alpha(x) = \tilde{c}_\alpha(x), \quad \alpha \in [0, 1].$$

We get (iii) since the convergence is uniform in  $\alpha \in [0, 1]$ .

Next we show that  $\tilde{c}$  is a solution of (2.1). Since  $\tilde{c}_\alpha(x) = A_\alpha(x)$ , we note that

$$\tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(\tilde{c}_\alpha(x)) = T_\alpha(\tilde{c}_\alpha(x)) = \tilde{c}_\alpha(x), \quad \alpha \in [0, 1]. \quad (2.7)$$

If  $\alpha > 0$ , then we have

$$\left\{ y \in E \mid \tilde{q}(x, y) \vee \max_{z \in E} \{\tilde{c}(x, z) \wedge \tilde{q}(z, y)\} \geq \alpha \right\} = \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(\tilde{c}_\alpha(x)).$$

If  $\alpha = 0$ , then in a similar way to the proof of [2, Lemma 1] we have

$$\text{cl} \left\{ y \in E \mid \max_{x \in E} \{\tilde{q}(x, y) \vee \max_{z \in E} \{\tilde{c}(x, z) \wedge \tilde{q}(z, y)\} > 0\} \right\} = \tilde{q}_0(x) \cup \tilde{q}_0(\tilde{c}_0(x)).$$

Therefore

$$\left\{ y \in E \mid \tilde{q}(x, y) \vee \max_{z \in E} \{\tilde{c}(x, z) \wedge \tilde{q}(z, y)\} \geq \alpha \right\} = \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(\tilde{c}_\alpha(x)) \quad \text{for } \alpha \in [0, 1].$$

Together with (2.7), we get

$$\left\{ y \in E \mid \tilde{q}(x, y) \vee \max_{z \in E} \{\tilde{c}(x, z) \wedge \tilde{q}(z, y)\} \geq \alpha \right\} = \tilde{c}_\alpha(x) \quad \text{for } \alpha \in [0, 1].$$

Therefore  $\tilde{c}$  satisfies (2.1). We prove the uniqueness of solution of (2.1). Let us denote by  $\tilde{c}' \in \mathcal{R}(E)$  another solution of (2.1). For  $x \in E$ ,  $\alpha \in [0, 1]$ , it is shown similarly that  $\tilde{c}'_\alpha(x) = \tilde{q}_\alpha(x) \cup \tilde{q}_\alpha(\tilde{c}'_\alpha(x))$ . That is,  $\tilde{c}'_\alpha(x)$  is a fixed point of  $T_{x,\alpha} : \mathcal{C}(E) \rightarrow \mathcal{C}(E)$ . From the uniqueness of the fixed point, we get  $\tilde{c}'_\alpha(x) = \tilde{c}_\alpha(x)$  for  $x \in E$ ,  $\alpha \in [0, 1]$ . By Lemma 3,  $\tilde{c}' = \tilde{c}$ . Thus we get (i).

Finally (ii) is trivial from (2.6), using Lemma 1 and  $\tilde{c}_\alpha(x) = A_\alpha(x)$  for  $x \in E$ ,  $\alpha \in [0, 1]$ . Thus the proof is completed.  $\blacksquare$

**THEOREM 2.** *It holds that*

$$\tilde{c}(x, y) = \bigvee_{n=1,2,\dots} \tilde{q}^n(x, y), \quad x, y \in E. \quad (2.8)$$

*Further  $\tilde{c}$  is the transitive closure of the fuzzy relation  $\tilde{q}$ , namely  $\tilde{c}$  satisfies (i) – (iii) :*

(i)  $\tilde{c} \geq \tilde{q}$ .

(ii)  $\tilde{c}$  has the transitive property :

$$\tilde{c}(x, y) \geq \sup_{z \in E} \{ \tilde{c}(x, z) \wedge \tilde{c}(z, y) \}, \quad x, y \in E. \quad (2.9)$$

(iii) If  $\tilde{r} \in \mathcal{R}(E)$  satisfies  $\tilde{r} \geq \tilde{q}$  and has the transitive property, then  $\tilde{r} \geq \tilde{c}$ .

PROOF. Let  $\tilde{r}(x, y) := \bigvee_{n=1,2,\dots} \tilde{q}^n(x, y)$ ,  $x, y \in E$ . Then we have  $\tilde{r} \geq \bigvee_{n=1,2,\dots,m} \tilde{q}^n = \tilde{c}^m$  for  $m = 1, 2, \dots$ . Therefore  $\tilde{r}_\alpha(x) \supset (\tilde{c}^m)_\alpha(x)$  for  $x \in E, \alpha \in [0, 1], m = 1, 2, \dots$ . From (2.2) we obtain  $\tilde{r}_\alpha(x) \supset \tilde{c}_\alpha(x)$  for  $x \in E, \alpha \in [0, 1]$ . Thus we get  $\tilde{r} \geq \tilde{c}$ .

On the other hand, from (2.1), we obtain  $\tilde{c} \geq \tilde{q}$  and

$$\tilde{c}(x, y) \geq \sup_{z \in E} \{ \tilde{c}(x, z) \wedge \tilde{q}(z, y) \} \geq \sup_{z \in E} \{ \tilde{q}(x, z) \wedge \tilde{q}(z, y) \} = \tilde{q}^2(x, y), \quad x, y \in E.$$

Repeating this argument inductively, we obtain  $\tilde{c} \geq \tilde{q}^n$  for  $n = 1, 2, \dots$ . Therefore  $\tilde{c}(x, y) \geq \tilde{c}^n(x, y)$  for  $x, y \in E, n = 1, 2, \dots$ . Thus we get  $\tilde{c} \geq \tilde{r}$ . Therefore we obtain (2.8).

Next we prove (i) – (iii). (i) is trivial from (2.1). From (2.8), we have

$$\begin{aligned} \tilde{c}(x, y) &\geq \bigvee_{n=1,2,\dots,m; \ n'=1,2,\dots,m'} \tilde{q}^{n+n'}(x, y) \\ &= \sup_{z \in E} \left\{ \bigvee_{n=1,2,\dots,m} \tilde{q}^n(x, z) \wedge \bigvee_{n'=1,2,\dots,m'} \tilde{q}^{n'}(z, y) \right\} \\ &= \sup_{z \in E} \{ \tilde{c}^m(x, z) \wedge \tilde{c}^{m'}(z, y) \}, \quad x, y \in E. \end{aligned}$$

Taking the supremum over  $m = 1, 2, \dots$  and  $m' = 1, 2, \dots$ , we obtain (ii). Finally let  $\tilde{r} \in \mathcal{R}(E)$  satisfy  $\tilde{r} \geq \tilde{q}$  and have the transitive property. Then

$$\tilde{r}(x, y) \geq \sup_{z \in E} \{ \tilde{r}(x, z) \wedge \tilde{r}(z, y) \} \geq \sup_{z \in E} \{ \tilde{q}(x, z) \wedge \tilde{q}(z, y) \} = \tilde{q}^2(x, y), \quad x, y \in E.$$

Repeating this argument inductively, we obtain  $\tilde{r} \geq \tilde{q}^n$  for  $n = 1, 2, \dots$ . Therefore  $\tilde{r}(x, y) \geq \tilde{c}^n(x, y)$  for  $x, y \in E, n = 1, 2, \dots$ . Thus we get  $\tilde{r} \geq \tilde{c}$ . Therefore (iii) holds. The proof is completed.  $\blacksquare$

### 3. Numerical example

Let  $E = [-2, 2]$  be a space of states. We consider a fuzzy relation (see [2, Figure 1])

$$\tilde{q}(x, y) = 1 - \left| y - \left( \frac{x}{2} + \frac{1}{4} \right) \right|, \quad x, y \in E. \quad (3.1)$$

Then we have

$$\tilde{q}^n(x, y) = 1 - \left| y - \left( \frac{1}{2^n}x + \frac{1}{2} - \frac{1}{2^{n+1}} \right) \right| \bigg/ \left( 2 - \frac{1}{2^{n-1}} \right), \quad x, y \in E, n = 1, 2, \dots. \quad (3.2)$$

From Theorem 2, we obtain

$$\tilde{c}(x, y) = \bigvee_{n=1,2,\dots} \left\{ 1 - \left| y - \left( \frac{1}{2^n}x + \frac{1}{2} - \frac{1}{2^{n+1}} \right) \right| / \left( 2 - \frac{1}{2^{n-1}} \right) \right\}, \quad x, y \in E. \quad (3.3)$$

Then (3.3) is the unique solution of Theorem 1 (see Figure 1).

Fig. 1 : The transitive closure  $\tilde{c}(x, y)$ .
