論 文 名 : Receptor for advanced glycation end products up-regulation in cerebral endothelial cells mediates cerebrovascular-related amyloid β accumulation after *Porphyromonas gingivalis* infection

(脳内皮細胞における終末糖化産物受容体の亢進は、*Porphyromonas gingivalis* 感染による脳血管が関与するアミロイド β の蓄積を誘導する)

区 分 : 甲

論 文 内 容 の 要 旨

Cerebrovascular-related amyloidogenesis is found in over 80% of Alzheimer's disease (AD) cases, and amyloid β ($A\beta$) generation is increased in the peripheral macrophages during infection of *Porphyromonas gingivalis* (*P. gingivalis*), a causal bacterium for periodontitis. In this study, we focused on receptor for advanced glycation end products (RAGE), the key molecule involves in $A\beta$ influx after *P. gingivalis* infection to test our hypothesis that $A\beta$ transportation from periphery into the brain, known as " $A\beta$ influx", is enhanced by *P. gingivalis* infection. Using cultured hCMEC/D3 cell line, in comparison to uninfected cells, directly infection with *P. gingivalis* (multiplicity of infection, MOI = 5) significantly increased a time-dependent RAGE expression resulting in a dramatic increase in $A\beta$ influx in the hCMEC/D3 cells; the *P. gingivalis*-up-regulated RAGE expression was significantly decreased by NF- κ B and Cathepsin B (CatB)-specific inhibitors, and the *P. gingivalis*-increased I κ B α degradation was significantly decreased by CatB-specific inhibitor. Furthermore, the *P. gingivalis*-increased $A\beta$ influx was significantly reduced by RAGE-specific inhibitor. Using 15-month-old mice (C57BL/6JJmsSlc, female), in comparison to non-infection mice, systemic *P. gingivalis* infection for three consecutive weeks (1×10^8 CFU/mouse, every 3 days, intraperitoneally) significantly increased the RAGE expression in the CD31-positive endothelial cells and the $A\beta$ loads around the CD31-positive cells in the mice's brains. The RAGE expression in the CD31-positive cells was positively correlated with the $A\beta$ loads. These observations demonstrate that the up-regulated RAGE expression in cerebral endothelial cells mediates the $A\beta$ influx after *P. gingivalis* infection, and CatB plays a critical role in regulating the NF- κ B/RAGE expression.
