#### Abstract

Treatment of 6,8-di-t-butyl-1,2,3,4-tetrahydro-9aH-pyrido[2,1-b] benzoxazole (3a) with conc. hydrochloric acid gave 2,4-di-t-butyl-6-piperidinophenol (4) and 2,4-di-t-butyl-6-(2-oxopiperidino) phenol (5) in 26 and $25 \%$ yields. Reaction of 3 a with acetic anhydride afforded 2,4-di-t-butyl-6-[1-(1,2, 3,4-tetrahydro-5-acetylpyridyl)]phenyl acetate (6) and 6,8-di-t-butyl-1-acetyl-2, 3,4,4a-tetrahydropyrido[2,1-b]benzoxazole (7) in 41 and $25 \%$ yields. Hofmann degradation of the quarternary salts of 3 a with methyl and ethyl iodide gave the expected ring-opend [1,4] oxazonines, 10a and 10b, in 43 and $10 \%$ yields, respectively.

Recently, we have reported ${ }^{1,2}$ the reductive cyclization of 1 -(3,5-di-t-butyl-2-hydroxyphenyl)pyridinium halide 1 and their inner salt 2 by treatment with Raney $\mathrm{Ni}-\mathrm{Al}$ alloy in an alkaline solution, giving 6,8-di-t-butyl-1,2,3,4-tetrahydro-9aH-pyrido[2,1-b]benzoxazole 3 .

Compound $\mathbf{3}$ is pharmacologically interesting because its skeleton resembles a part of the structure of vomicine which has a strychnine-like biological activity. In fact, we experienced numbness in an oral cavity though 3 was handled with an extreme care. Therefore, it is of interest to investigate the chemical reactivity of 3 .

We now report the ring-opening reaction of $3 \mathrm{a}(\mathrm{R}=\mathrm{H})$ with hydrochloric acid and acetic anhydride and Hofmann degradation of quarternary salt of 3 a .

## Results and Discussion

(1) Reaction with conc. hydrochloric acid and acetic anhydride

Treatment of 3a with conc. hydrochloric acid in methanol at reflux for 16 h gave piperidino-

[^1]phenol $4^{31}$ and (2-oxopiperidino) phenol 5 in 26 and $25 \%$ yields, respectively. The structures of 4 and 5 were deduced from their spectral data; in IR spectrum of 5 , carbonyl absorption band was observed at $1635 \mathrm{~cm}^{-1}$, thus suggesting the presence of amide-skeleton. Compound 4 corresponds to the reductively ring-opened product of 3 a , while 5 to the oxidatively ring-opened one.

Reaction of 3 a with acetic anhydride at reflux for 1 h afforded two products, 6 and 7, in 41 and $25 \%$ yields, respectively. In IR spectrum of 6, a broad band was observed at 1610-1580 $\mathrm{cm}^{-1}$, which is ascribed to $\beta$-ketoenamine-type carbonyl absorption. ${ }^{1} \mathrm{H}$-NMR spectrum of 6 showed a singlet at 7.30 ppm . Thus, the structure of 6 was deduced as [1-(1,2,3,4-tetrahydro-5acetylpyridyl)]phenyl acetate. Compound 7 was elucidated as 2,3,4,4a-tetrahydropyrido[2,1-b]benzoxazole from its spectral data and from the fact that 7 was obtained in $79 \%$ yield when 5 was treated with refluxing acetic anhydride.

Compound 6 is not a precursor of 7 and vice versa as both 6 and 7 are stable in refluxing acetic anhydride. Compound 4 gave 8 in $92 \%$ yield, but not 6. Thus, tentative formation pathway of $4-7$ is proposed in Scheme 1. Protonation of 3 might give $\mathbf{A}-1$ which oxidize $\mathbf{3 a}$

to give 4 and B. Hydrolysis of B gives 5. Compound 5 is cyclized to $\mathbf{C}$ by acetic anhydride. As the $\mathrm{C}=\mathrm{C}$ double bond of $\mathbf{C}$ is considered to have a combined nature of those of enamine and vinyl ether, it is acetylated to give 7. On the other hand, treatment of 3 a with acetic anhydride afforded A-2 which gives enamine D. Acetylation of enamine D gives 6. But, formation pathway of $\mathbf{7}$ in the reaction of $\mathbf{3 a}$ with acetic anhyclride is not konwn.

## (2) Hofmann degradation

Hofmann degradation of quaternary salts, $\mathbf{9 a}$ and $\mathbf{9 b}$, in the presence of silver oxide afforded the expected 9 -membered heterocycles, 10a and 10b, in 43 and $10 \%$ yields, respectively, together with free base 3a. Stereochemistry of olefinic part in $\mathbf{1 0}$ is cis from ${ }^{1} \mathrm{H}-\mathrm{NMR}$. Treatment of $\mathbf{1 0 a}$ with hydroiodic acid gave recyclized $\mathbf{9 a}$ in $42 \%$ yield.

## Experimental

All melting points are uncorrected. IR spectra were measured on a JASCO A-102 spectrophotometer as KBr pellet or liquid films on $\mathrm{NaCl} .{ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were determined in $\mathrm{CDCl}_{3}$ at 100 MHz on a JEOL FX-100 spectrometer with $\mathrm{Me}_{4} \mathrm{Si}$ as an internal standard. Mass spectra were obtained on a JEOL JMS-O1SG-2 spectrometer at 75 eV using a direct inlet system. Column chromatography was carried out on silica gel (Wako gel, C-300).
